

Eclipse® Model 706 High Performance Guided Wave Radar Level Transmitter

DESCRIPTION

The new Eclipse® Model 706 High Performance Transmitter is a loop-powered, 24 VDC level transmitter that is based upon the proven and accepted technology of Guided Wave Radar (GWR). Encompassing a number of significant engineering accomplishments, this leading edge level transmitter is designed to provide measurement performance well beyond that of many of the more traditional technologies.

Utilizing “diode switching” technology, along with the most comprehensive probe offering on the market, this single transmitter can be used in a wide variety of applications ranging from very light hydrocarbons to water-based media.

The innovative angled, dual compartment enclosure is now a common sight in the industry. This enclosure, first brought to the industry by Magnetrol® in 1998, is angled to maximize ease of wiring, configuration, and viewing of the versatile graphic LCD display.

One universal Model 706 transmitter can be used and interchanged with all probe types, and offers enhanced reliability as it is suitable for use in critical SIL 2 hardware safety loops.

The ECLIPSE Model 706 supports both the FDT/DTM and Enhanced DD (EDDL) standards, which allow viewing of valuable configuration and diagnostic information such as the echo curve in tools such as PACTware™, AMS Device Manager, and various HART® Field Communicators.

Eclipse® Model 706 DTM

Measures Level, Interface, Volume and Flow

APPLICATIONS

MEDIA: Liquids, solids, or slurries; hydrocarbons to water-based media (Dielectric Constant $\epsilon_r = 1.2-100$)

VESSELS: Most process or storage vessels up to rated probe temperature and pressure.

CONDITIONS: All level measurement and control applications including process conditions exhibiting visible vapors, foam, surface agitation, bubbling or boiling, high fill/empty rates, low level and varying dielectric media or specific gravity.

FEATURES

- Multivariable, two-wire, 24 VDC loop-powered transmitter for level, interface, volume, or flow.
- Diode switching technology offers best-in-class signal strength and signal-to-noise ratio (SNR) resulting in enhanced capability in difficult low dielectric applications.
- Level measurement not affected by changing media characteristics.
- No need to move levels for calibration.
- Overfill Capable probes allow for “true level” measurement all the way up to the process seal, without the need for special algorithms.
- 4-button keypad and graphic LCD display allow for convenient viewing of configuration parameters and echo curve.
- Proactive diagnostics advise not only what is wrong, but also offer troubleshooting tips.
- Nine common tank shapes for volumetric output.
- 30-point custom strapping table for uncommonly-shaped tanks.
- Two standard flumes and four standard weirs of various sizes for flow measurement.
- Generic flow equation for non-standard channels.
- 360° rotatable housing can be separated from probe without depressurizing the vessel.
- Probe designs up to +850° F/6250 psi (+450° C/431 bar).
- Saturated steam applications up to 2250 psi @ +650° F (155 bar @ +345° C).
- Cryogenic applications down to -320° F (-196° C).
- Transmitter can be remote-mounted up to 12 feet (3.6 m) away from the probe.
- FMEDA evaluation allows use in SIL 2 Loops (full FMEDA report available).
- No moving parts.

TECHNOLOGY

PRINCIPLE OF OPERATION

ECLIPSE Guided Wave Radar is based upon the technology of TDR (Time Domain Reflectometry). TDR utilizes pulses of electromagnetic energy transmitted down a wave guide (probe). When a pulse reaches a surface that has a higher dielectric constant than the air ($\epsilon_r = 1$) in which it is traveling, a portion of the pulse is reflected. The transit time of the pulse is then measured via high speed timing circuitry that provides an accurate measure of the liquid (or solids) level. The amplitude of the reflection depends on the dielectric constant of the product. The higher the dielectric constant, the larger is the reflection.

INTERFACE MEASUREMENT

The ECLIPSE Model 706 is capable of measuring both an upper liquid level and an interface liquid level. As only a portion of the pulse is reflected from a low dielectric upper surface, some of the transmitted energy continues down the GWR probe through the upper liquid. The remaining initial pulse is again reflected when it reaches the higher dielectric lower liquid. It is required that the upper liquid has a dielectric constant less than 10, and the lower liquid has a dielectric constant greater than 15. A typical interface application would be oil over water, with the upper layer of oil being non-conductive ($\epsilon_r \approx 2.0$), and the lower layer of water being very conductive ($\epsilon_r \approx 80$). The thickness of the upper layer could be as small as 2" (50 mm) while the maximum upper layer is limited to the length of the GWR probe.

SPECIAL APPLICATIONS

EMULSION LAYERS

As emulsion layers, also called “rag layers,” can decrease the strength of the reflected signal in an interface application, GWR transmitters are typically recommended for applications that have clean, distinct layers.

However, the ECLIPSE Model 706, with its powerful internal measurement algorithms, will tend to detect the top of an emulsion layer. Contact the factory for application assistance regarding emulsion layers in your specific application.

SATURATED STEAM APPLICATIONS (Boilers, Feedwater Heaters, etc.)

As the temperature of a saturated steam application increases, the dielectric constant of the steam vapor space also increases. This increase in vapor space dielectric causes a delay in the GWR signal propagation as it travels down the probe, causing the liquid level to appear lower than actual.

NOTE: The measurement error associated with this propagation delay does depend on temperature and is a function of the square root of the vapor space dielectric constant. For example, with no compensation, a +450° F (+230° C) application would show a level error of about 5.5%, while a +600° F (+315° C) application would show an error approaching 20%!

The ECLIPSE Model 706 transmitter and Model 7yS Coaxial Steam probe provide a unique solution to this application. The effects of the changing steam conditions can be compensated for by utilizing a mechanical steam target placed inside and near the top of the Model 7yS coaxial probe.

Knowing exactly where the target is located at room temperature, and then continuously monitoring its apparent location, the vapor space dielectric can be back-calculated. Knowing the vapor space dielectric, accurate compensation of the actual liquid level reading is accomplished.

This is a patented technique with two US Patents (US 6642801 and US 6867729) issued for both the mechanical target concept and the associated software algorithm.

Contact the factory for additional information relating to saturated steam applications.

OVERFILL CAPABILITY

Although agencies like WHG or VLAREM certify **Overfill proof** protection, defined as the tested, reliable operation when the transmitter is used as overfill alarm, it is assumed in their analysis that the installation is designed in such a way that the vessel or side mounted cage cannot physically overflow.

However, there are practical applications where a GWR probe can be completely flooded with level all the way up to the process connection (face of the flange). Although the affected areas are application dependent, typical GWR probes have a transition zone (or possibly dead zone) at the top of the probe where interacting signals can either affect the linearity of the measurement or, more dramatically, result in a complete loss of signal.

While some manufacturers of GWR transmitters may use special algorithms to “infer” level measurement when this undesirable signal interaction occurs and the actual level signal is lost, the ECLIPSE Model 706 offers a unique solution by utilizing a concept called **Overfill Safe Operation**.

An **Overfill safe probe** is defined by the fact that it has a predictable and uniform characteristic impedance all the way down the entire length of the waveguide (probe). These probes allow the ECLIPSE Model 706 to measure accurate levels up to the process flange without any non-measurable zone at the top of the GWR probe.

Overfill safe GWR probes are unique to ECLIPSE GWR, and coaxial probes can be installed at any location on the vessel. Overfill safe probes are offered in a variety of Coaxial and Caged designs.

PROBE OVERVIEW

THREE STYLES OF GWR PROBES

With one basic ECLIPSE Model 706 transmitter that operates with all probes, choosing the proper Guided Wave Radar (GWR) probe is the most important decision in the application process. The probe configuration establishes fundamental performance characteristics.

All ECLIPSE Model 706 probes can be described by three basic configurations:

- Coaxial
- Twin flexible cable
- Single element (rigid rod or flexible cable)

COAXIAL PROBES

The coaxial probe is the most efficient of all GWR probe configurations and should be the first consideration in all applications. Analogous to the efficiency of coaxial cable, a coaxial probe allows almost unimpeded movement of the high frequency pulses throughout its length.

The electromagnetic field that develops between the inner rod and outer tube is completely contained and uniform down the entire length of the probe. See Figure 1. This means that the coaxial probe is immune to any proximity affects from other objects in the vessel, and therefore, in essence, it can be used anywhere that it can mechanically fit.

The efficiency and overall sensitivity of a coaxial configuration yields robust signal strength, even in extremely low dielectric ($\epsilon_r \geq 1.4$) applications. The sensitivity of this “closed” design, however, also makes it more susceptible to measurement error in applications that can have coating and buildup.

All ECLIPSE Model 706 coaxial probes are Overfill Safe as standard, by design.

Figure 1
Coaxial Probe

Each of these probe configurations has specific strengths and weaknesses. Although there can be overlap, and different probes can certainly be used in similar applications, it is important to understand their basic differences so that one can choose the probe type that will offer optimal performance.

The descriptions below are facts relating to the physics of GWR technology and are not specific to the ECLIPSE Model 706.

BASIC—FOR CLEAN LIQUIDS

The basic 0.875" (22.5 mm) diameter coaxial GWR probe is only recommended for use in clean applications or special applications such as saturated steam. Teflon®, PEEK, or alumina spacers centering the inner rod within the outer tube are located at 24" (60 cm) intervals, resulting in a perfect characteristic impedance along the entire length of the probe.

This probe is recommended in applications with viscosities up to 500 cP (mPa.s) maximum.

ENLARGED—FOR DIFFICULT LIQUIDS

The standard Enlarged 1.75" (45 mm) or 1.93" (49mm) diameter coaxial GWR probes can be generally used for most applications. They can be installed directly into the tank as well as into bypass cages, stillwells or bridles.

The robust construction reduces the number of spacers required, allowing the probe to be used in applications where higher risk of buildup exists. To further reduce the possibility of media buildup, the use of a single bottom spacer is recommended up to probe lengths of 100 inches (2.54 meters). The overall sensitivity and performance of an enlarged coaxial GWR probe is identical to a standard coaxial GWR probe, but it offers the very important advantage that it can be used in applications with viscosities up to 2,000 cP (mPa.s).

PROBE OVERVIEW CONTINUED

THREE STYLES OF GWR PROBES

OPTIONAL FLUSHING CONNECTION

The maintenance of coaxial GWR probes in applications suffering from buildup or crystallization can be significantly improved by using an optional flushing connection. This flushing connection is a metal extension with a port welded above the process connection. The port allows the user to purge the inside of the coaxial GWR probe during routine maintenance.

Note: The best approach to eliminate the effects of condensation or crystallization is to install adequate insulation or heat tracing (steam or electrical). A flushing connection is no substitute for proper maintenance, but will help to reduce the frequency of the intervention.

CAGED-FOR DIRTY LIQUIDS

Unique to MAGNETROL, the Caged GWR probe is a single rod probe which uses an existing or new cage, bridle, or stillwell as the second conductor to re-create the same signal propagation of a coaxial GWR probe. Caged GWR probes are designed for 2" (DN50), 3" (DN80) or 4" (DN100) diameter metal chambers, and utilize a specially designed impedance matching section that results in the same overall characteristic impedance of a coaxial style GWR probe.

Caged GWR probes offer the same sensitivity and performance as coaxial GWR probes, but the single conductor design allows it to be used in applications with viscosities up to 10,000 cP (mPa.s).

OPTIONAL ANNUNCIATOR FITTING

High Pressure and High Temperature High Pressure ECLIPSE Model 706 probes containing a glass ceramic alloy process seal (Models 7yD, P, J, L, M and N) are available with an optional annunciator fitting. The use of this fitting complies with the Dual Seal requirements of

ANSI/ISA-12.27.01-2011, titled "Requirements for Process Sealing between Electrical Systems and Flammable or Combustible Process Fluids," which require the incorporation of a method that indicates or annunciates a primary seal failure (e.g., visible leakage, an audible whistle, or other means of monitoring).

TWIN CABLE FLEXIBLE PROBES

The relationship of the Twin Cable probe design to a coaxial probe design is similar to that of older, twin-lead, antenna lead-in to modern, coaxial cable. 300-ohm twin-lead cable simply does not have the efficiency of 75-ohm coaxial cable, making the parallel conductor design less sensitive than the concentric coaxial. See Figure 2. This translates into Twin Cable GWR probes having the ability to measure dielectrics down to $\epsilon_r \geq 1.7$.

Heavy bridging of material between the cables across the FEP coating can cause improper measurement and should be avoided.

Figure 2 also shows that, although most of the electromagnetic field develops between the two cables, there is also some peripheral energy that expands outward, making the Twin Cable probe more sensitive to proximity effects of objects located immediately around it. For that reason, it is recommended to keep the active element of the Twin Cable probe at least 1 inch (25 mm) away from metal objects.

Figure 2
Twin Flexible Probe

SINGLE ROD PROBES

Single element GWR probes act quite differently than both coaxial and twin cable designs. With only one conductor to work with, the pulses of energy develop between the single rod probe and the mounting nut or flange. In other words, the pulse propagates down and around the rod as it references its ground at the top of the tank.

The energy and efficiency of the pulse are directly related to how much metallic surface exists around it at the top of the vessel. This metallic surface at the top of the probe is called the “launch plate.” The larger the launch plate, the more efficient the signal propagation down the probe.

Figure 3 shows the single element design and how the electromagnetic pulse effectively expands into a teardrop shape as it propagates away from the top of the tank (the inherent ground reference). This single element configuration (rod or cable) is the least efficient of the three probe types, but can still operate with a minimum dielectric detection of approximately $\epsilon_r > 1.7$ in an open, non-metallic vessel.

However, this dielectric constant performance improves considerably ($\epsilon_r > 1.4$) when the single rod probe is installed in a metal cage/bridle, or mounted 2–6" (50–150 mm) away from a metal tank wall. Because the design is “open,” it exhibits two strong tendencies:

- It is the most forgiving of coating and buildup. (The PFA-insulated probe is the best choice for severe buildup and coating).
- It is most affected by proximity issues.

It is important to note that a parallel metal wall INCREASES the performance of a single rod probe while a singular, metal object protruding out near the probe may be improperly detected as a liquid level.

These tendencies are application/installation dependent. Therefore, by properly matching the single rod probe to a cage/chamber, the ECLIPSE Model 706 broad offering of caged probes combines the performance/sensitivity advantages of a coaxial probe and the viscosity immunity of a single rod probe. The Caged Probes are Overfill Safe by design, can be used in interface and other difficult, low dielectric applications, and are unique to MAGNETROL and the ECLIPSE Model 706.

Contact the factory for additional support and questions.

① 2nd digit A=English, C=Metric

② Minimum ϵ_r 1.2 with end of probe analysis enabled.

③ Single rod probes mounted directly into the vessel must be within 3–6 inches of metal tank wall to obtain minimum dielectric of 1.4, otherwise ϵ_r min = 1.7.

④ Depends on the probe spacer material. Refer to Model Selection for spacer options.

⑤ ECLIPSE probes containing o-rings can be used for vacuum (negative pressure) service, but only those probes with glass seals are hermetically sealed to <10⁻⁸ cc/sec @ 1 atmosphere helium.

⑥ Consult factory for overfill applications

⑦ Overfill capability can be achieved with software.

⑧ Scheduled for future release.

TRANSMITTER SPECIFICATIONS

Enlarged	50 feet (15 m) max. segmented	N/A
Transition Zones ①		
Top	0 inches (0 mm)	8 inches (200 mm)
Bottom	$\epsilon_r = 1.4$: 6 inches (150 mm) ④, $\epsilon_r = 80$: 2 inches (50 mm)	$\epsilon_r = 80$: 2 inches (50 mm)
Process Temperature	-320° to +850° F (-196° to 450° C)	-58° to +575° F (-50° to +300° C)
Max. Process Pressure ②	6250 psi @ +70° F (431 bar @ +20°C)	1275 psi @ +575° F (87.9 bar @ +300°C)
Dielectric Range	1.4 to 100 ⑤	10 to 100
Vacuum Service ③	Full Vacuum	Full Vacuum
Viscosity		
Enlarged	2000cP (mPa.s)	N/A
Basic	500cP (mPa.s)	500cP (mPa.s)
Media Coating	Filming	Filming

① Transition zones (areas with reduced accuracy) are dielectric dependent. It is recommended to set the 0-100% measuring range outside of the transition zones.

② Refer to chart on page 16.

③ ECLIPSE probes containing o-rings can be used for vacuum (negative pressure) service, but only those probes with glass seal are hermetically sealed to <10⁻⁸ cc/sec @ 1 atmosphere helium.

④ Can be reduced to 3" (75 mm) when lower accuracy is acceptable.

⑤ 1.2 minimum dielectric when end of probe analysis is enabled.

⑥ Consult factory for overfill applications.

Flanged	Various ANSI, EN1092, and proprietary flanges	Various ANSI, EN1092, and proprietary flanges
Available Probe Length	3 to 100 feet (1 to 30 meters)	3 to 100 feet (1 to 30 meters)
Transition Zones ①		
Top	18 inches (45 cm)	18 inches (45 cm)
Bottom	12 inches (30 cm)	12 inches (30 cm)
Dielectric Range ②	4 to 100	1.7 to 100
Vacuum Service ③	Negative Pressure, but no hermetic seal	Negative Pressure, but no hermetic seal
Viscosity	10,000 (mPa.s)	10,000 (mPa.s)
Media Coating	Max. Error 10% of coated length (% Error is dependent on dielectric & thickness)	Max. Error 10% of coated length (% Error is dependent on dielectric & thickness)

① Transition zones (areas with reduced accuracy) are dielectric dependent. It is recommended to set the 0-100% measuring range outside of the transition zones.

② 1.2 minimum dielectric when end of probe analysis is enabled.

③ ECLIPSE probes containing o-rings can be used for vacuum (negative pressure) service, but only those probes with glass seal are hermetically sealed (helium leak <10⁻⁶cc/sec @ 1 atmos.).

NOTES:

- 7yS steam probes are rated to 1275 psi (88 bar) up to +575° F (+300° C)
- 7y3, 7y6 HTHP flexible probes:
Pressure is limited by the chamber
- 7y2, 7y5 bulk solids probes: 50 psi (3.45 bar) to +150° F (+65° C)
- High pressure probes with threaded fittings are rated as follows:
7yD, 7yN, 7yP and 7y3 probes with threaded fittings have 3600 psi (248 bar) rating. 7yM probes with threaded fittings have 2016 psi (139 bar) rating.

O-RING (SEAL) SELECTION CHART

O-RING/SEAL SPECIFICATIONS

Code	"O"-Ring Material	Max. Process Temperature	Min. Process Temperature	Max. Process Pressure	Not Recommended For Applications	Recommended for Applications
0	Viton® GFLT	400 °F @ 230 psi (200 °C @ 16 bar)	-40° F (-40° C)	1000 psi 70° F (70 bar @ 20°C)	Ketones (MEK, acetone), skydrol fluids, amines, anhydrous ammonia, low molecular weight esters and ethers, hot hydrofluoric or chlorosulfuric acids, sour HCs	General purpose, ethylene
1	EPDM	250 °F @ 200 psi (125 °C @ 14 bar)	-60° F (-50° C)	1000 psi 70° F (70 bar @ 20°C)	Petroleum oils, di-ester base lubricant, steam	Acetone, MEK, skydrol fluids
2	Kalrez® 4079	400 °F @ 232 psi (200 °C @ 16 bar)	-40° F (-40° C)	1000 psi 70° F (70 bar @ 20°C)	Hot water/steam, hot aliphatic amines, ethylene oxide, propylene oxide	Inorganic and organic acids (including hydro fluids and nitric), aldehydes, ethylene, organic oils, glycols, silicone oils, vinegar, sour HCs
3	HSN (Highly Saturated Nitrile)	275 °F @ 320 psi (135 °C @ 22 bar)	-4° F (-20° C)	1000 psi 70° F (70 bar @ 20°C)	Halogenated HCs, nitro HCs, phosphate ester hydraulic fluids, ketones (MEK, acetone), strong acids, ozone, automotive brake fluid, steam	NACE applications
4	Buna-N	275 °F @ 320 psi (135 °C @ 22 bar)	-4° F (-20° C)	1000 psi 70° F (70 bar @ 20°C)	Halogenated HCs, nitro HCs, phosphate ester hydraulic fluids, ketones (MEK, acetone), strong acids, ozone, automotive brake fluid	General purpose sealing, petroleum oils and fluids, cold water, silicone greases and oils, di-ester base lubricants, ethylene glycol base fluids
5	Neoprene®	300 °F @ 290 psi (150 °C @ 20 bar)	-65° F (-55° C)	1000 psi 70° F (70 bar @ 20°C)	Phosphate ester fluids, ketones (MEK, acetone)	Refrigerants, high anline point petroleum oils, silicate ester lubricants
6	Chemraz® 505	400 °F @ 200 psi (200 °C @ 14 bar)	-20° F (-30° C)	1000 psi 70° F (70 bar @ 20°C)	Acetaldehyde, ammonia + lithium metal solution, butyraldehyde, di-water, freon, ethylene oxide, liquors, isobutyraldehyde	Inorganic and organic acids, alkalines, ketones, esters, aldehydes, fuels
7	Polyurethane	200 °F @ 420 psi (95 °C @ 29 bar)	-65° F (-55° C)	1000 psi 70° F (70 bar @ 20°C)	Acids, Ketones, chlorinated HCs,	Hydraulic systems, petroleum oils, HC fuel, oxygen, ozone
8	Aegis PF128 ①	400 °F @ 232 psi (200 °C @ 16 bar)	-4° F (-20° C)	1000 psi 70° F (70 bar @ 20°C)	Black liquor, freon 43, freon 75, galden, KEL-F liquid, molten potassium, molten sodium	Inorganic and organic acids (including hydro fluids and nitric), aldehydes, ethylene, organic oils, glycols, silicone oils, vinegar, sour HCs, steam, amines, ethylene oxide, propylene oxide, NACE applications
A	Kalrez® 6375	400 °F @ 232 psi (200 °C @ 16 bar)	-40° F (-40° C)	1000 psi 70° F (70 bar @ 20°C)	Hot water/steam, hot aliphatic amines, ethylene oxide, propylene oxide	Inorganic and organic acids (including hydro fluids and nitric), aldehydes, ethylene, organic oils, glycols, silicone oils, vinegar, sour HCs
D or N	Glass Ceramic Alloy	850 °F @ 3600 psi (450 °C @ 248 bar)	-320° F (-195° C)	6250 psi 70° F (431 bar @ 20°C)	Hot alkaline solutions HF acid, media with ph>12, direct exposure to saturated steam	General high temperature/high pressure applications, hydrocarbons, full vacuum (hermetic), ammonia, chlorine

① Maximum +300° F (+150° C) for use on steam.

REPLACEMENT OF DISPLACER TRANSMITTERS

ECLIPSE has proven to be the ideal replacement for existing torque tube transmitters. In numerous applications worldwide, customers have found the performance of ECLIPSE Guided Wave Radar transmitters to be superior to that of antiquated torque tube transmitters.

There are several benefits to using the ECLIPSE Model 706 as a replacement for torque tube transmitters:

- **Cost:**
The cost of a new Model 706 transmitter cost is comparable to rebuilding an aging torque tube.
- **Installation:**
No field calibration is necessary. The Model 706 transmitter can be configured in minutes with no level movement. (Complete factory pre-configuration is available, which can further decrease the installation effort).
- **Performance:**
The ECLIPSE Model 706 is unaffected by changes in specific gravity and has no moving parts that can wear and lose tolerance.

- **Ease of replacement:**
Proprietary and standard ANSI flanges are offered on all ECLIPSE Model 706 probes so existing chamber/cages can be used.

In order to match the proper ECLIPSE transmitter with the proper external cage, consider the following:

- **Type of application:**
Use the proper GWR probe for the application, see pages 7 and 10 through 16.

- **Overfill proof:**
For optimum performance, use an Overfill-safe probe in all chamber applications.

Note: “Overfill” occurs when the level rises above the maximum range of operation. *Some GWR probes may provide erroneous output in this zone unless an optimal, impedance-matched design is used.*

- **Minimum Cage Size:**
 - Coaxial or Caged Coaxial probes: 2" minimum
 - Enlarged Coaxial probes: 3" minimum
 - Twin Cable probes: 4" minimum

Recommended probe length for replacing displacer transmitters

The table below helps to define the GWR probe length for the most common displacer transmitters. Refer to the proprietary flange selection guide.

Manufacturer	Type	Process Connection	Displacer Length inches (mm)	Probe Length ^① inches (mm)
MAGNETROL	EZ & PN Modulevel®	ANSI/EN flange	≥ 14" (356)	Displacer + 7 (178)
Masoneilan®	Series 1200	Proprietary flange	≥ 14" (356)	Displacer + 8 (203)
		ANSI/EN flange	≥ 16" (406)	Displacer + 8 (203)
Fisher® series 2300 & 2500	249B, 259B, 249C cages	Proprietary flange	≥ 14" (356)	Displacer + 10 (254)
	other cages	ANSI flange	≥ 14" (356)	consult factory
Eckardt®	Series 134, 144	ANSI/EN flange	≥ 14" (356)	consult factory
Tokyo Keiso®	FST-3000	ANSI/EN flange	H = 11.8" (300)	Displacer + 9 (229)
		ANSI/EN flange	≥ H = 19.7" (500)	Displacer + 9 (229)

^① Round down resulting calculation to the nearest inch.

PROPRIETARY FLANGES

Fisher 249B/259B (600 lb.), carbon steel

Fisher 249C (600 lb.), 316 stainless steel

Masoneilan (600 lb.), carbon steel

MAGNETROL CHAMBERS

A brief description of the MAGNETROL chamber offering follows. For more details, refer to MAGNETROL Sales Bulletin 41-140.

MAGNETROL has a long tradition in offering cost-effective chambers. The MAGNETROL external chamber is a self-contained cage designed for use with our top mounting level transmitters or switches. Quality construction and a wide selection of configurations make this cage an ideal means of utilizing the power of Guided Wave Radar without mounting directly into the process vessel.

MAGNETROL chambers are available with a wide variety of options, and can be manufactured to comply with various regulations such as:

- Commercial Design
- ASME B31.1 Design Code
- ASME B31.3 Design Code
- NACE Design Code
- PED

Some Model 706 probes can be installed into chambers as small as 2". When a new chamber is required, it can be

ordered together with a factory pre-configured Model 706 for a true "plug and play" installation.

For example:

A standard Model 706-511A-310 explosion-proof transmitter with a Model 7AG-4300-A10-00-021 Caged probe can be used in a 2" chamber. A typical chamber Model Number would be:

F21-4A2D-014

Refer to MAGNETROL Sales Bulletin 41-140 for details on chamber Model Numbers and additional options.

The Most Efficient PC Configuration Tool for Eclipse® Guided Wave Radar Transmitters

PACTware™ is the modern, user-friendly adjustment software that enables quick configuration and diagnosis of your HART® or FOUNDATION fieldbus™ Guided Wave Radar transmitters.

GET CONNECTED Simply connect the HART/RS232 or HART/USB serial interface from the PC to the two-wire loop.

Level Monitoring Screen Continuously viewing the level in a tank is the starting point for PACTware™. The position of liquid level can be viewed in a simple visual format on your PC. Level and Output values are shown numerically as well. The screen can be left open to show the relative position of the liquid level.

Level Monitoring Screen

Parameters Screen Every parameter in your radar transmitter can be monitored and modified remotely with a few clicks of the mouse. From units of measure to settings for dielectric, each parameter can be viewed or changed to suit application conditions. Parameters can be developed offline or transferred between transmitters.

Parameters Screen

Trending Screen The ability to trend data over a period of time allows insight into overall operation of your GWR transmitter. Trending values are invaluable when attempting advanced configuration or troubleshooting. PACTware™ PC software has the ability to track all parameters of your radar device and save them as a text or picture file.

Process Trend Screen

Echo Curve Screen This screen yields a wealth of useful information: Level; Echo Strength; Actual Echo Curve; Echo Rejection; and Threshold. Blue cursors show the location and echo strength of the reflection currently detected as liquid level.

Echo Curve Screen

	706-5XX-3XX	Explosion-proof (with Intrinsically Safe probe) Dust Ignition-proof	Class I, Div. 1; Groups B, C & D Class II, Div. 1; Groups E, F, & G T4 Class III, Type 4X, IP67
	706-5XX-3XX	Non-Incendive, Suitable for:	Class I, Div. 2; Groups A, B, C, & D Class II, Div. 2; Groups E, F & G T4 Class III, Type 4X, IP67
CSA 	706-5XX-1XX	Intrinsically Safe	Class I, Div. 1; Groups A, B, C, & D Class II, Div. 1; Group E, F & G T4 Class III, Type 4X, IP66/67 Entity
	706-5XX-3XX	Explosion-proof (with Intrinsically Safe probe) Dust Ignition-proof	Class I, Div. 1; Groups B, C, & D Class II, Div. 1; Group E, F & G T4 Class III, Type 4X, IP66/67
	706-5XX-3XX	Non-Incendive Suitable for:	Class I, Div. 2; Groups A, B, C, & D Class II, Div. 2; Group E, F & G T4 Class III, Type 4X, IP66/67
ATEX 	706-5XX-AXX	Intrinsically Safe	II 1G, Ex ia IIC T4 Ga
	706-5XX-CXX	Non-sparking	II 1/3 G Ex nA [ja Ga] IIC T4 Ga/Gc
	706-5XX-DXX	Dust Ex	II 1/2 Ex tb [ja] IIIC T85°C .. T450°C Db
	706-5XX-BXX	Flame Proof	II 1/2 G Ex d [ja] IIC T6 .. T1 Ga/Gb
IEC	706-5XXX-AXX	Intrinsically Safe	Ex ia IIC T4 Ga
	706-5XXX-CXX	Non-sparking	Ex nA [ja Ga] IIC T4 Ga/Gc
	706-5XXX-BXX	Flame Proof	Ex d [ja] IIC T6 .. T1 Ga/Gb

These units are in conformity of:

1. The EMC Directive: 2004/108/EC. The units have been tested to EN 61326.

Note: Single and twin rod probes must be used in metallic vessel or stillwell to maintain CE compliance.

Dual seal approval per ANSI/ISA-12.27.01

Single seal approval per ANSI/ISA-12.27.01

MODEL NUMBER

TRANSMITTER

Models available for quick shipment, usually within one week after factory receipt of a complete purchase order, through the Expedite Ship Plan (ESP).

1 2 3 | BASIC MODEL NUMBER

7 0 6	ECLIPSE 4th Generation Guided Wave Radar (GWR) Level Transmitter
-------	--

4 | POWER

5	24 VDC, Two-Wire
---	------------------

5 | SIGNAL OUTPUT

1	4–20 mA with HART
2	FOUNDATION fieldbus™ Communications

6 | SAFETY OPTIONS

0	None – FOUNDATION fieldbus only (5th digit = 2)
1	SIL 2 Hardware - HART only (5th digit = 1)

7 | ACCESSORIES/MOUNTING

0	No Digital Display or Keypad - Integral
1	No Digital Display or Keypad - 3-foot (1 meter) remote
2	No Digital Display or Keypad - 12-foot (3.6 meter) remote
A	Digital Display and Keypad - Integral
B	Digital Display and Keypad - 3-foot (1 meter) remote
C	Digital Display and Keypad - 12-foot (3.6 meter) remote

8 | CLASSIFICATION

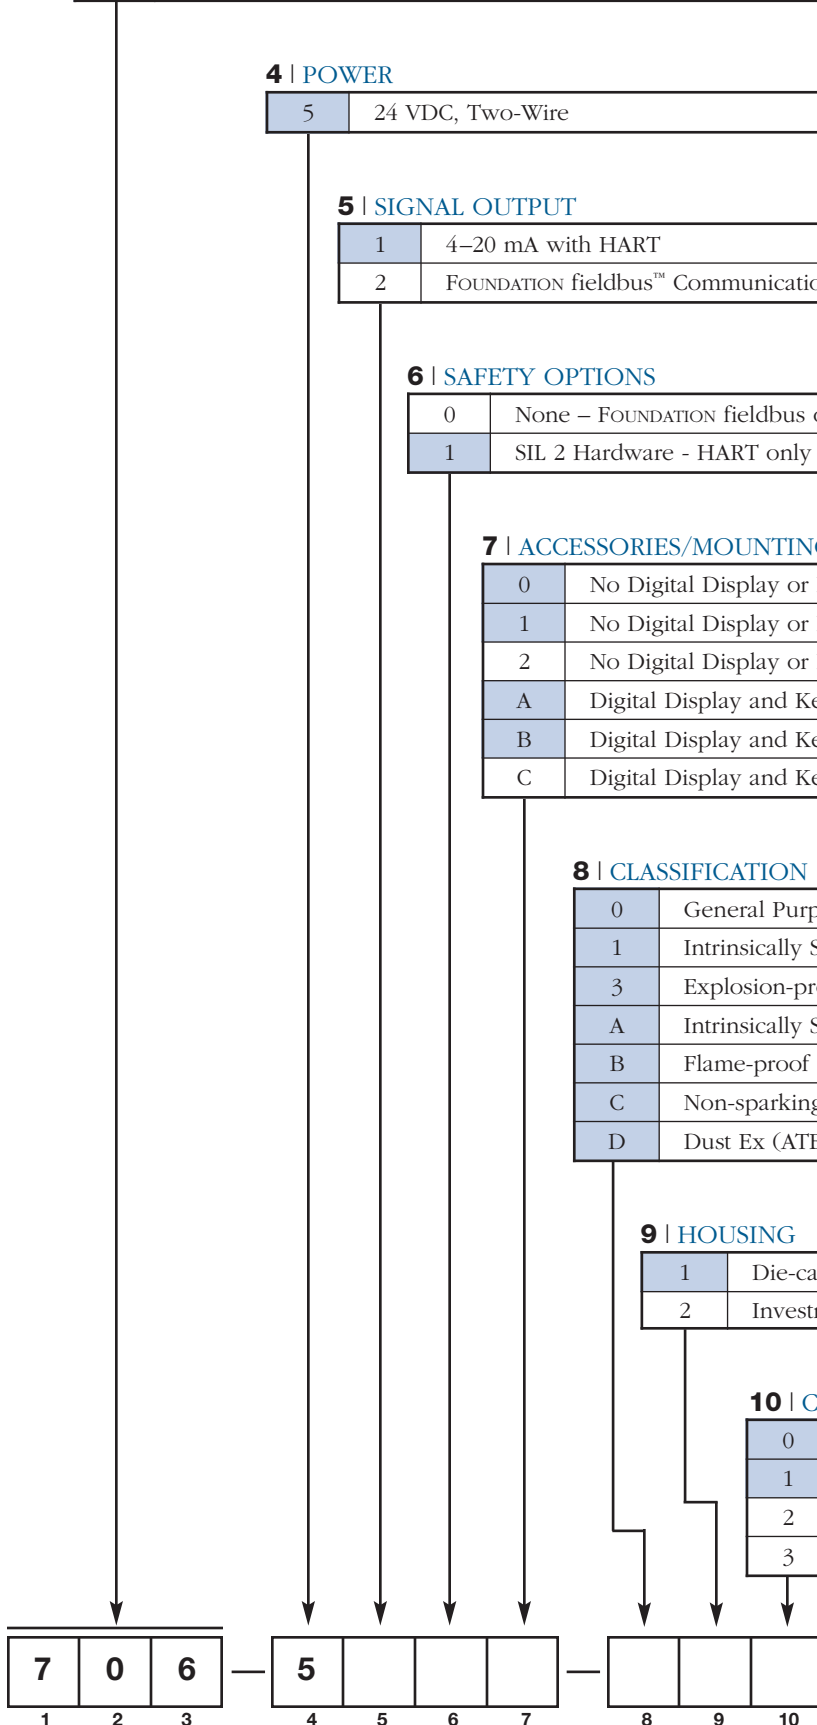

0	General Purpose, Weatherproof (IP 67)
1	Intrinsically Safe (FM & CSA CL 1 Div 1, Grps A, B, C, D)
3	Explosion-proof (FM & CSA CL 1 Div 1, Grps B, C, D)
A	Intrinsically Safe (ATEX/IEC Ex ia IIC T4)
B	Flame-proof (ATEX/IEC Ex d ia IIC T6)
C	Non-sparking (ATEX Ex n IIC T6)
D	Dust Ex (ATEX II)

9 | HOUSING

1	Die-cast Aluminum, Dual-compartment, 45-degree
2	Investment Cast, Stainless Steel, Dual-compartment, 45-degree

10 | CONDUIT CONNECTION

0	½" NPT
1	M20
2	½" NPT with sunshade
3	M20 with sunshade

“IN TANK” STANDARD SINGLE ROD PROBE MOUNTING CONSIDERATIONS

For Rigid Models 7yF, M, N and Flexible Models 7y1, 2, 4 and 6

1. Turbulence

The bottom of rigid probes should be stabilized if turbulence will cause a deflection of more than 3" (75 mm) at the end of a 10' (3 m) length. The probe should not make contact with metal.

2. Nozzle

Single rod performance in nozzles can be improved by ensuring the following:

- Nozzle must be 2" (50 mm) or larger diameter.
- Nozzle should be as short as possible.
- Nozzle inside diameter (A) should be \geq to nozzle height (B).
 - If this is not the case, adjustments to BLOCKING DISTANCE and/or SENSITIVITY parameters may be required.

Correct Installation

Pipe reducers should not be used

3. Metallic (conductive) obstructions in tank.

Although it depends on the transmitter configuration, objects in the proximity of the probe can cause erroneous readings. Please refer to the table below for guidelines, but please contact the factory with any questions as the distances shown can be reduced with the use of PACT^{ware}™.

Distance to probe	Acceptable objects
< 6" (150 mm)	Continuous, smooth, parallel, conductive surface (e.g. metal tank wall); probe should not touch tank wall
> 6" (150 mm)	< 1"/DN25 diameter pipe and beams, ladder rungs
> 12" (300 mm)	< 3"/DN80 diameter pipe and beams, concrete walls
> 18" (450 mm)	All remaining objects

Note: A metal stillwell/cage of max. 6"/DN150 size or a metal tank wall parallel to the probe within 6" (150 mm) will allow the unit to operate accurately in media with dielectrics down to ϵ_r 1.4.

4. Non-metallic vessels

A metal flange is highly recommended for optimum performance in plastic vessels.

NOTE: Single rod probes must be used in metallic vessels or stillwell to maintain CE noise immunity.

Shutdown /Overfill protection

Special consideration is necessary in any shutdown/overfill protection application where single rod GWR probes are used. To ensure proper measurement, use Overfill Capable single rod probes, such as the Model 7yG, L, or J Caged probes in the appropriate cage/chamber/stillwell.

Mounting Considerations for Single Flexible probes measuring Bulk Solids

The Model 7y2 Bulk Solid probe is designed for a 3000 lb. (1360 kg) pull-down force for use in applications such as sand, plastic pellets, and grains.

- To reduce excessive stresses on the top of the vessel, do not secure the metal probe weight to the bottom of the vessel.
- Mount the probe at least 12 inches from the wall. The ideal location is $\frac{1}{4}$ to $\frac{1}{2}$ the diameter to average the angle of repose.

TWIN FLEXIBLE PROBE DIMENSIONS

Twin Flexible GWR Probe
end view

Model 7y5
with flanged connection

Model 7y7
with flanged connection

“IN TANK” TWIN FLEXIBLE PROBE MOUNTING CONSIDERATIONS

For Models 7y7

1. Turbulence

The bottom of Twin Flexible probes can be secured to the bottom of the vessel by using the TFE weight at the bottom of the probe. The TFE weight has a ½" (13 mm) hole that can be utilized to “u-bolt” the probe to the bottom of the vessel.

The probe should not make contact with metal.

2. Nozzle

Twin Flexible probe performance in nozzles can be improved by ensuring the following:

- Nozzle should be 3" (DN80) diameter or larger.
- Nozzle should be as short as possible.

3. Metallic (conductive) obstructions in tank.

Mount the Twin Flexible probe more than 1" (25 mm) from any metallic object/vessel wall.

Mounting Considerations for Twin Flexible Model 7y5 probes measuring Bulk Solids:

The Model 7y5 Bulk Solid probe is designed for a 3000 lb. (1360 kg) pull-down force for use in applications such as sand, plastic pellets, and grains.

- To reduce excessive stresses on the top of the vessel, do not secure the metal probe weight to the bottom of the vessel.
- Mount the probe at least 12 inches from the wall. The ideal location is ¼ to ½ the diameter to average the angle of repose.

The Orion Instruments® Aurora® is the patented combination of the ECLIPSE Guided Wave Radar transmitter and a Magnetic Level Indicator (MLI). The integration of these two independent technologies provides excellent redundancy. A custom float positioned within the AURORA chamber travels up and down following level changes. The float contains an internal group of magnets that are “coupled” with magnets in the flags of the visual indicator mounted on the outside of the chamber. As the float moves, the flags rotate to expose the color of their opposite side. The position where the flag’s color changes corresponds to a point on the measuring scale indicating true level. In addition to this external visual indicator operated by the AURORA internal float, the ECLIPSE Model 706 transmitter reflects electromagnetic radar pulses directly off the liquid surface providing a real-time continuous level output.

Refer to Orion Instruments® Sales Bulletin ORI-138 for details and additional options on AURORA chambers.

Regardless of whether a standard chamber or AURORA chamber is being used it is important to remember:

- Ensure that the Model 706 probe extends at least 4" (100 mm) past the lower process connection of the chamber
- Utilize Overfill-capable probes for optimal GWR performance.

QUALITY

The quality assurance system in place at MAGNETROL guarantees the highest level of quality throughout the company. MAGNETROL is committed to providing full customer satisfaction both in quality products and quality service.

The MAGNETROL quality assurance system is registered to ISO 9001 affirming its commitment to known international quality standards providing the strongest assurance of product/service quality available.

ESP

Expedite **S**hip **P**lan

Several Models of ECLIPSE Guided Wave Radar Transmitters are available for quick shipment, usually within one week after factory receipt of a complete purchase order, through the Expedite Ship Plan (ESP). Models covered by ESP service are color coded in the selection data charts.

To take advantage of ESP, simply match the color coded model number codes (standard dimensions apply).

ESP service may not apply to orders of ten units or more. Contact your local representative for lead times on larger volume orders, as well as other products and options.

WARRANTY

All MAGNETROL electronic level and flow controls are warranted free of defects in materials or workmanship for one full year from the date of original factory shipment.

If returned within the warranty period; and, upon factory inspection of the control, the cause of the claim is determined to be covered under the warranty; then, MAGNETROL will repair or replace the control at no cost

to the purchaser (or owner) other than transportation.

MAGNETROL shall not be liable for misapplication, labor claims, direct or consequential damage or expense arising from the installation or use of equipment. There are no other warranties expressed or implied, except special written warranties covering some MAGNETROL products.

For additional information, see Instruction Manual 57-606.

ECLIPSE Guided Wave Radar transmitters may be protected by one or more of the following U.S. Patent Nos. US 6,062,095; US 6,247,362; US 6,588,272; US 6,626,038; US 6,640,629; US 6,642,807; US 6,690,320; US 6,750,808; US 6,801,157; US 6,867,729; US 6,879,282; 6,906,662. May depend on model. Other patents pending.
